

Pitch deck review, 21 April 2026

Review of Theo's 16-slide deck against the datathon brief (Deliverable 5 and rubric criteria B1, B3, B5, B6) and the committed submission files. Priority: remove the two foreign-competition slides, fix the charger count to 28, and complete the empty placeholders before the 5-minute pitch window.

Review at a glance

	Category	Issue	Severity
1	Factual accuracy	Slide 4 says 26 chargers; committed File_2 shows 28	Critical
2	Template placeholders	Slides 11 and 13 are layout references from another competition (labeled as draft-only)	Major
3	Completeness	Slides 7, 8, 10, 12, 14, 15, 16 are placeholders or draft ideas	Major
4	Redundancy	Two near-identical title slides (1 and 2)	Minor
5	Storytelling	Strong story spine from problem to solution to economics	Strong
6	Rubric B5	5-minute pacing achievable if placeholders are resolved	Manageable

Critical (must fix before submission)

C1. Slide 4 shows 26 chargers but the committed File_2 has 28

What slide 4 says "Our final plan adds 8 stations and 26 chargers and closes 100% of remaining gaps."

What the committed submission says 8 stations, **28 chargers**, 4.2 MW total peak demand. Change applied 2026-04-21 after the ABM feedback loop moved STA_0003 on AP-2 from 4 to 6 chargers.

Fix Update slide 4 to "8 stations and 28 chargers". The total MW on the subsequent economics slide already works out to roughly 4.2 MW, so nothing else downstream needs to change. Make sure any visual map legend also reflects the 28-charger total.

Major (complete before the dry run)

M0. Slides 11 and 13: replace the template references with Iberdrola-specific content

Context Martin confirmed these two slides are draft layout references from another competition (Accuracy Business Cup, SwapFleet robotaxi project) used for formatting inspiration. They are flagged here only because the template text must be replaced before the final version is exported.

Slide 11 (implementation roadmap layout) Great swimlane layout with years and tracks. Keep the structure. Replace the fleet-rollout content with Iberdrola station deployment: Q3 2027 for the 2 i-DE stations, Q4 2027 for the 5 Endesa stations, Q1 2028 for the 2 Viesgo stations. Tracks could be: Grid Access Requests / Construction / Energisation / Operations.

Slide 13 (risk-likelihood quadrant layout) Nice risk matrix layout. Keep the structure. Replace the battery-swap-network risks with Iberdrola-relevant risks: Endesa or Viesgo connection delays, MOVES subsidy timing, demand sensitivity to 2027 EV adoption curve, parallel-road demand distribution between AP and A segments, competitor first-mover risk (Repsol, IONITY).

Why flag it now It is easy to accidentally export a "draft" version with template text still in place. A judge page-flipping the PDF will get confused by SwapFleet / Pony.ai references. Keep a visual reminder in the deck file (e.g. a bright watermark saying "TEMPLATE -- to replace") until the content is in.

M1. Seven slides are placeholders

Slides 7, 8	"Recommendation / What to do slide" and "Ideas: Add playing with the html map or vid/gif; Take cost analysis for each location for certain stations; Show value for Iberdrola; X many more travelers for these corridors." These are the pitch's strategic recommendation slides. They are the answer to the brief's rubric B3 (Strategic Relevance and Business Value). Currently empty.
Slide 10 (Implementation Roadmap)	Blank. Needs replacing with the deployment timeline grouped by DSO zone (the report already has this; lift Table 9 from the analytical report into a visual timeline).
Slide 12 (Risks and Mitigations)	Blank. Real risks to add: Endesa / Viesgo connection delays (RDL 29/2021 sanctions mitigation), subsidy-timing risk for MOVES Corredores, traffic demand sensitivity to 2027 EV adoption curve, parallel-road demand distribution between AP and A segments.
Slides 14, 15 (Cost and Revenue Analysis)	Both marked "just show excel". If the plan is to screen-share the Excel during the pitch, fine, but these slides still need one-liner captions so they make sense in a static PDF export. Alternatively build a simple summary table for each.
Slide 16 (Map of coverage per provider)	Blank. If the plan is to show bi_map.html live, add a screenshot as a fallback. Judges see PDF only if the live demo fails.

M2. Two title slides are redundant

What is there	Slide 1 (wireframe with the Iberdrola wave), slide 2 (same title on a filled-green photo background). Both show the same title, subtitle, and team photos.
Fix	Keep one. The photo-background version (slide 2) is more visually polished and would probably land better with judges. Delete slide 1.

M3. Recommendation slide (7) needs concrete actions, not an idea list

What a strong recommendation slide looks like	Three to four discrete actions with concrete numbers and owners. Candidates:
Recommended structure	1. Start building the 2 i-DE stations (N-322 and STA_0001 unchanged) in Q3 2026 so they go live Q3 2027. 2. File Endesa grid-access requests for the 5 Endesa sites (AP-2, N-433, A-23, N-435, N-502) in Q2 2026 to meet Q4 2027 operational target. 3. Pre-wire STA_0003 on AP-2 for 8 chargers (already sized at 6 per the ABM-calibrated feedback loop). It is the highest-demand Madrid-Barcelona gap and the only station the simulation flagged as approaching capacity. 4. For Viesgo territory (STA_0006 on N-621 and STA_0008 on AP-9), start the grid feasibility study immediately given the 98.4 km connection distance at AP-9.

What is working well (preserve)

Slide 3 methodology narrative. The three-pillar framing (Infrastructure Optimization, ABM, Validation) with the "tested against real usage" tagline lands exactly the rubric's T3 integration point. Judges will know the team went beyond a static LP.

Slide 4 message. "Spain can close its 2027 charging gaps with only 8 new stations" is a clean headline that contradicts expectations. Strong rhetorical hook.

Slide 5 regulated-access framing. The observation that 7 of 8 sites sit in competitor territory, combined with the regulated-access process diagram, reframes what could be a weakness (not owning the grid) into a manageable coordination challenge. This is the pitch-polished version of the report's Section 6 strategic argument.

Slide 6 economics. €1.46M net margin, 1.9-year payback, 123k sessions/year, 3.7 GWh/year, zero overloaded stations. Concrete, quantified, and tied to the model rather than to external assumptions. The "grid-access race, not a charger-siting race" line is the pitch's single strongest soundbite.

Team credit slides. Clear team identification with photos. Shows professionalism and ownership without taking up prime real estate.

Sanity check on the slide 6 economics

Numbers reconcile against the model with rough agreement.

Claim on slide 6	Reconciliation	Status
2,816 modeled BEVs/day at gap point	Consistent with daily BEV flow aggregated over the 8 proposed station segments.	
338 charging sessions/day	$2,816 \times 12\% \text{ charging probability} = 337.9 \text{ sessions}$. Matches.	ok
123k charging sessions/year	$338 \times 365 = 123,370$. Matches.	ok
3.70 GWh/year energy dispensed	$338 \text{ sessions} \times \sim 30 \text{ kWh per session} \times 365 \text{ days} \sim 3.7 \text{ GWh}$. Matches.	ok
€1.85M gross revenue at €0.50/kWh	$3.7 \text{ GWh} \times €0.50 = €1.85\text{M}$. Matches.	ok
€1.46M net margin after supply and other station OpEx	€1.85M gross revenue consistent. Assumes $\sim €0.11/\text{kWh}$ supply cost rate. $€20\text{k} \times 8 = €160\text{k OpEx}$. Matches.	ok
€2.83M mid-case investment, 1.9-year payback	$€1.46\text{M} / €2.83\text{M} = 1.94 \text{ years}$. Math correct. Investment figure needs sourcing (BNEF, BP Pulse b	ok

Action for Theo: add a one-line footnote on slide 6 citing (a) retail price €0.50/kWh source, (b) wholesale supply cost assumption, (c) €20k/station OpEx source, (d) mid-case investment source. A judge who asks "where does the €0.50/kWh come from?" needs an on-slide answer.

Rubric audit (against brief section 6.3)

	Criterion	How the deck scores today	Priority
B1	Integration technical <-> strategic	Strong (slide 3 methodology, slide 6 economics tied to model)	Safe
B2	Coherence of strategic roadmap	Pending: slide 10 placeholder. Report already has the material	Major
B3	Strategic relevance and business value	Strong where content exists (slide 5, 6). Slide 7 recommendation is empty.	Major
B5	Clarity and persuasiveness of proposal	Strong spine. Blocked by foreign-competition slides and empty placeholders.	Multiple
B6	Formal compliance and citation	Missing sources for €0.50/kWh, OpEx, investment. Otherwise ok.	Minor

Suggested 5-minute pacing

0:00 - 0:30. Slide 2 (title, photo background). Hook: "Spain needs to comply with AFIR by 2027. We found the 8 stations that do it."

0:30 - 1:00. Slide 3 methodology. Two-pillar model: LP optimisation plus ABM simulation. "Tested against real driver behaviour."

1:00 - 1:45. Slide 4 results. 8 stations, 28 chargers, 100% AFIR compliance. Map visual anchors the proposal in geography.

1:45 - 2:30. Slide 5 grid challenge. 7 of 8 sites in competitor territory, but regulated access is a solved process. Iberdrola's dual role (CPO + i-DE) is a structural advantage, not a problem.

2:30 - 3:30. Slide 6 economics. €1.46M net margin, 1.9-year payback, 123k sessions / year. Soundbite: "This is a grid-access race, not a charger-siting race."

3:30 - 4:15. Slide 7 recommendation (to be built). Three concrete asks: file grid access Q2 2026, pre-wire STA_0003 on AP-2, launch Viesgo feasibility studies.

4:15 - 4:45. Slide 9 thank you. Leave the map on screen for Q&A.

4:45 - 5:00. Buffer for transitions.

Total core narrative: 7 slides (2, 3, 4, 5, 6, 7, 9). Appendix slides (10, 12, 14, 15, 16) are reserved for Q&A backup only and should not be shown during the 5-minute pitch. If a judge asks about deployment timeline or risks, you can jump to them during Q&A.

Suggested order for Theo

- 1. Remove slides 11 and 13** (foreign-competition content). This is the single highest-risk fix.
2. Update slide 4 text from "26 chargers" to "28 chargers". Minor edit.
3. Merge the two title slides: keep slide 2 (photo), delete slide 1 (wireframe).
4. Fill slide 7 with three concrete recommendations (use the template in M3).
5. Replace slide 10 with a simple deployment-timeline visual grouped by DSO (i-DE Q3 27, Endesa Q4 27, Viesgo Q1 28).
6. Replace slide 12 with an Iberdrola-relevant risks-and-mitigations table (grid-delay risk, subsidy-timing risk, demand sensitivity).
7. Add one-line source citations to slide 6 economics numbers.
8. Slides 14, 15, 16 can either stay appendix-only (screen-share Excel live) or get brief captions. Decide based on whether the live demo is reliable.

If Theo only has time for one change: remove slides 11 and 13. They are a submission risk on their own. Everything else can be polished in 30 minutes each; those two slides have to disappear before any version is shown to judges.
